

The **Security** **Gaps** Attackers Hope You Miss

Web applications and APIs are your fastest-growing attack surface and your most under-tested one. Every new release, integration, or code push can introduce exploitable vulnerabilities in hours. Traditional penetration tests happen annually. Attackers scan daily. That gap is exactly where breaches begin.

Why Organizations Struggle

- Applications change faster than manual security assessments can keep pace with, leaving windows of exposure measured in weeks or months.
- APIs introduce logic-layer vulnerabilities that traditional scanners miss entirely: authentication flaws, broken object-level authorization, and excessive data exposure.
- Alert noise from legacy tools forces analysts to chase false positives instead of remediating real, exploitable risk.
- Compliance mandates (PCI DSS, HIPAA, CERT-In) require continuous evidence, not a point-in-time report filed once a year.

87% of organizations experienced an API security incident in the last 12 months, yet most still rely on annual assessments to find them.

Meet Seceon aiDAST360™

Seceon aiDAST360 tests your web applications and APIs daily, not annually, from an attacker's perspective. It identifies exploitable vulnerabilities before they become incidents, then feeds findings directly into the Seceon OTM Platform so your SOC can correlate, triage, and respond rather than just receive a report.

With aiDAST360, You Can:

- Continuously scan web apps and APIs every release, every update, not just quarterly.
- Prioritize findings by actual exploitability and business impact, not raw vulnerability count.
- Cut false positive noise so analysts remediate real risk instead of chasing scan artifacts.
- Generate audit-ready compliance evidence for PCI DSS, ISO 27001, HIPAA, NIST, and CERT-In continuously.
- Trigger SOC response automatically when findings match active threat activity in the OTM Platform.

From discovery to remediation, aiDAST360 continuously validates your web and API security posture.

Stop Treating Application Security as an Annual Event.

aiDAST360 validates your applications every day so vulnerabilities get fixed before attackers find them.
